# TUPM Configurator

*Only available for Windows but using Wine for Mac should work (not tested yet)*
**This only works for firmware Rx.1.0 or higher**
This tool lets you configure range settings and other things using the Ultra Pitch Mod.

Red,Blue and Green modes can be set to your own preference but in steps of 2%.
You can replace the MIDI mode with other features. There are still functions under developent.

When you have your settings done press "Generate SREC file" and save the file.
Transfer the file the same way you would update firmware.

The advanced window lets you change the RGB led lights.

The values represent raw ADC values (12bits) at 3.3V reference. Be a bit careful here.

RED_R, _G, _B refers to the red pitch mode. Same for the rest and orange is Midi mode.
